Credit Risk Dashboard | Portfolio Overview

Clients	Total ECL (NT$)	Total EAD (NT$)
9,000	72,47M	462M

Data: UCI Default of Credit Card Clients (Taiwan). Test set: 9,000 clients. Amounts in NT$. LGD = 75% (assumption). Stress scenarios are synthetic.

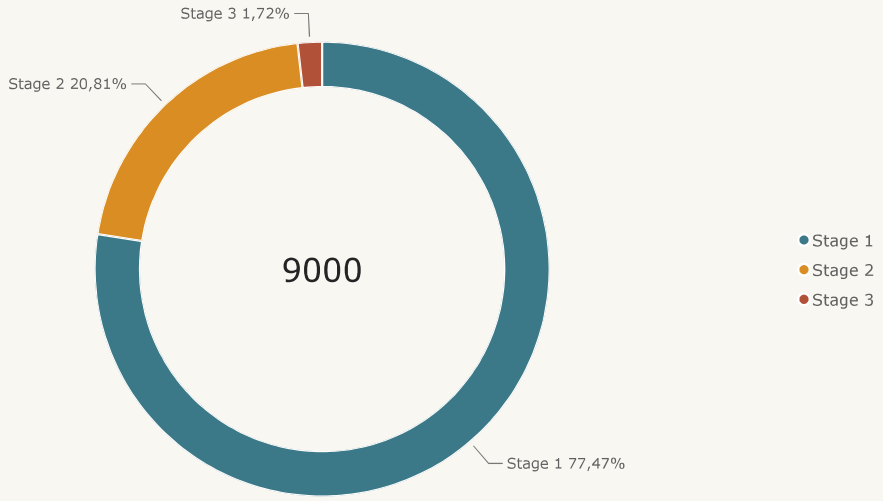

ECL by IFRS 9 Stage (NT$)

Coverage Ratio by Stage

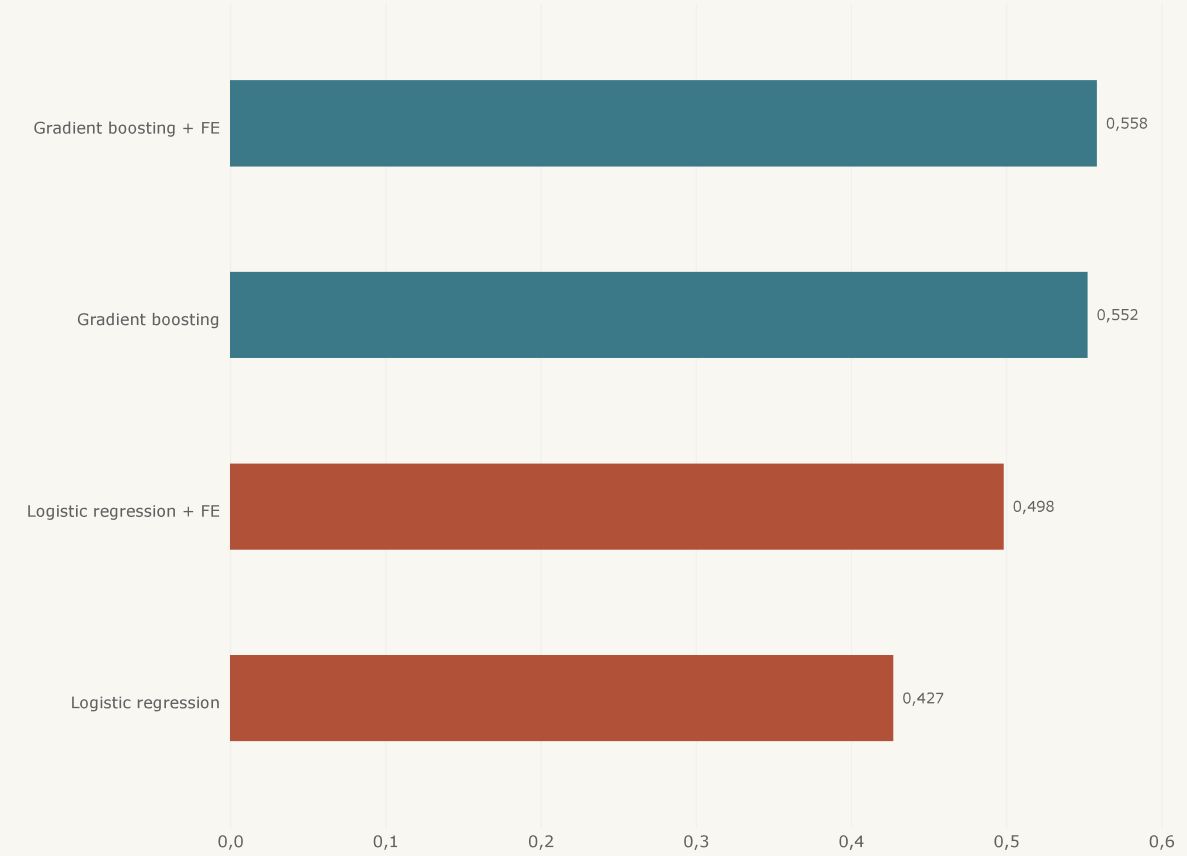

Stage Label	Sum of EAD	Sum of ECL	Coverage Ratio
Stage 1	370086949	31.220.777,76	8,4%
Stage 2	83930143	35.460.028,33	42,2%
Stage 3	7717684	5.788.263,00	75,0%

Clients by IFRS 9 Stage

Model Performance Analysis

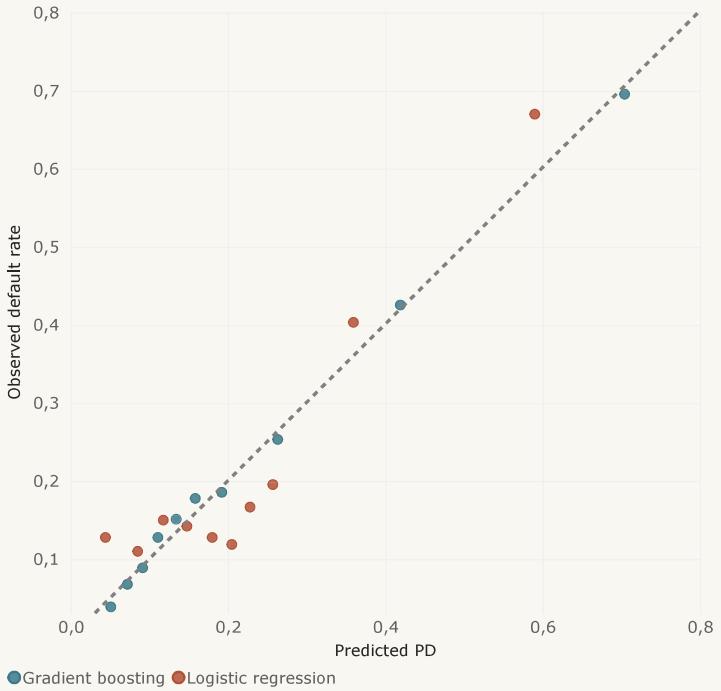

Gini by Model

Model Metrics (test set)

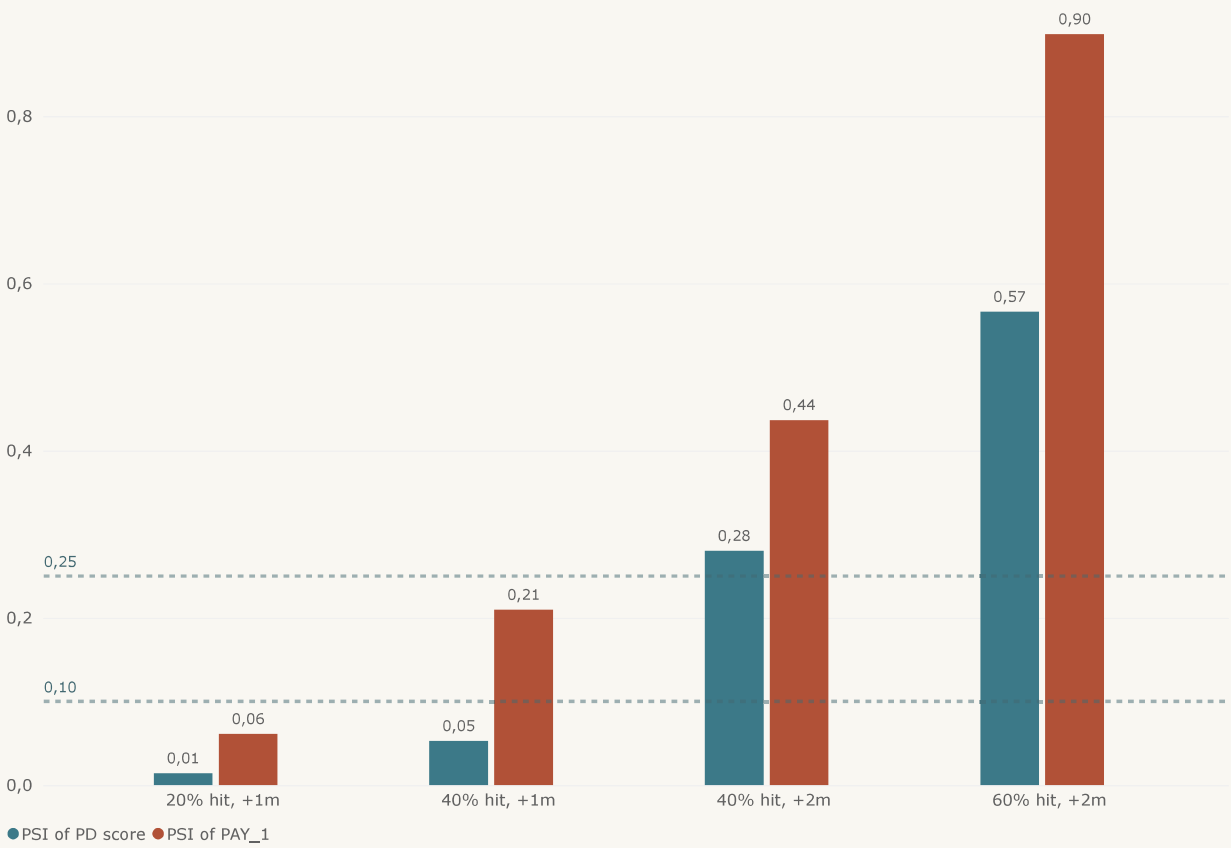

model	AUC	Gini	KS	Brier
Gradient boosting	0,776	0,552	0,419	0,136
Gradient boosting + FE	0,779	0,558	0,419	0,135
Logistic regression	0,714	0,427	0,372	0,146
Logistic regression + FE	0,749	0,498	0,398	0,142

Calibration: Predicted PD vs Observed Default Rate

Model Monitoring and Stress Scenarios

PSI by Deterioration Scenario

Dashed lines: PSI 0.10 = moderate shift (monitor), PSI 0.25 = significant shift (review the model)

Stress Scenarios: PD and PSI

Scenario	mean_PD	PSI_score	PSI_PAY_1
20% hit, +1m	0,23	0,01	0,06
40% hit, +1m	0,25	0,05	0,21
40% hit, +2m	0,34	0,28	0,44
60% hit, +2m	0,39	0,57	0,90

How to read this page

PSI (Population Stability Index) compares the distribution of the model score, or of an input variable, with a reference sample.

Dashed lines: 0.10 = moderate shift (monitor), 0.25 = significant shift (review the model).

Scenarios are synthetic stress tests: a share of clients has PAY_1 increased by 1 or 2 months. They are not real drift.

Key takeaway: PSI of PAY_1 crosses 0.10 before the PD score does (40% hit, +1m), so monitoring the inputs gives an earlier warning. At +2 months the score itself crosses 0.25 and the mean PD rises from 22% to 34%.
